Technology

Deployable, Disposable Security Technology provides the building blocks for nearly any customer unique or open source application(s) to be bundled on a bootable CD Rom.

Traditional network boundaries are rapidly disintegrating due to the advent of virtual private networks, web-based email, and a whole host of applications that tunnel protocols over the World Wide Web. Our company's interface will help system administrators and Information Assurance professionals seek to maintain the keen situational awareness that provides maximum visibility in knowing what is taking place on their networks.

Wireless networks are becoming more and more prevalent in today's communications schema. They are not without their threats and vulnerabilities. Would you just like a better understanding of the surrounding WiFi environment? Is your network besieged with a rogue? Wireless survey applications bundled using DDST can provide that data. Builds have already been created to help customers solve the need to survey, identify and monitor wireless networks within their location as well as wireless access points. All performed in a manner that a rogue access point/system would not be able to detect.

A new dimension to the virtual world

Configurable to your unique requirements

Bootable CD Rom

Operational solutions in minutes

Let the Futures security engineers demonstrate a cost effective and user friendly product to advance you and your company.
